MBC12101 Driver Features

- Size (4.50”L x 3.500”W x 0.935”H)
- Output Current 10.0 Amps Peak
- Built in Short Circuit and Mis-Wire Shut Down
- Fixed Step Resolution of 2000 Steps per Revolution
- No Minimum Inductance
- Optical Isolation of Control Inputs
- Motor ON/OFF Input

General Description

The MBC12101 Microstep Motor Driver has an output current capability of 1.5 Amps minimum to 10.0 Amps maximum (Peaking Rating). The MBC12101 driver operates from a DC voltage of 20-80 Volts. The inputs are optically isolated with a minimum sourcing of 1.0 mA per input (+3.5VDC minimum to +8.6VDC maximum). The clock input is set to receive either positive or negative edge clocks with a maximum frequency of 100KHz. The MBC12101 driver offers direction control, motor current ON/OFF capabilities, and built in short circuit and mis-wire shutdown. The Reduce Current Enabled automatically reduces motor current to 50% of set value after the last step is made. The driver has built-in features to indicate power on (Green LED) and Clocks being received (Yellow LED). The MBC12101 has a fixed step resolution of 2000 steps per revolution with a 200 step/revolution stepper motor and the bipolar drive configurations handles 4, 6, and 8 lead motors.

Optically Isolated Input Pin Descriptions

The inputs of the MBC12101 are optically isolated with the anode (+) and cathode (-) both brought out to the user. With no current going through the opto-diode the input is considered high. To enable the input a minimum of 1.0 mA needs to be sourced or sunked through the opto-diode. This is done simply by placing a voltage of +3.5 to +8.6VDC across the two inputs of the opto-diode. If sourcing current into the inputs, then all three cathodes (-) should be tied together and grounded as shown in Figure 3. If sinking current, then all three anodes (+) should be tied together to the +voltage as shown in Figure 4.

To enable an input, apply a DC voltage source of +5VDC to 8.6VDC across the inputs. The Anodes (+) are pins 7, 9, and 11 and the Cathodes (-) are pins 8, 10, and 12.

Connecting the Step Motor

Phase 1 and 3 of the Step Motor is connected between pins 3 and 4 on the terminal block connector. Phase 2 and 4 of the Step Motor is connected between pins 5 and 6 on the terminal block connector. Refer to Figures 3 & 4 for Typical Application Hook-Up.

NOTE: The physical direction of the motor with respect to the direction input will depend on the connection of the motor windings. To reverse the direction of the motor with respect to the direction input, swap the wires on Phase 1 and Phase 3.

WARNING: Do not connect or disconnect motor wires while power is applied! This driver does not protect itself if the motor is disconnect while powered.

12 Pin Terminal Block Description

Pin #	Description
1	0VDC: Return path for driver voltage
2	20-80VDC: Input voltage for the driver (+20-80VDC)
3	A: Phase 1 of the Step Motor
4	Ā: Phase 3 of the Step Motor
5	B: Phase 2 of the Step Motor
6	B̄: Phase 4 of the Step Motor
7	ON/OFF: On/Off Anode (+) - This isolated input is used to enable and disable the output section of the driver. When HIGH (open) the outputs are enabled. However, this input does not inhibit the step clock.
8	ON/OFF: On/Off Cathode (-)
9	Dir+: Direction Anode (+) - This isolated input is used to change the direction of the motor. Physical direction also depends on the connection of the motor windings.
10	DIR-: Direction Cathode (-)
11	Clock+: Step Clock Input Anode (+) - A positive going edge on this isolated input advances the motor one increment. The size of the increment is dependent on the Microstep Select Inputs of Switch 1.
12	Clock-: Step Clock Input Cathode (-)

Table 1: Pin Descriptions for Terminal Block

Power Supply Requirements

It is recommended that the MBC12101 be powered by the PSA80V4A or the PSAM48V3.2A. The PSA80V4A is a 80 Volt, 4 Amp power supply that will take either 110VAC or 220 VAC inputs and deliver 320 Watts. The PSAM48V3.2A is a 48 Volt, 3.2 Amp power supply with a universal input to accept input voltages in the range of 95- 265VAC and deliver 150Watts.

Power Supply Drawings for PSA80V4A and PSAM48V3.2A

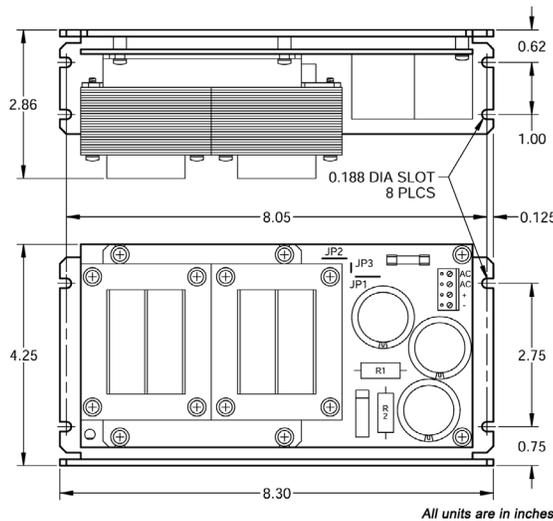

Figure 1: Dimensions for PSA80V4A

Note:

1. For 110VAC Input Install JP1 & JP2 Only.
2. For 220VAC Input Install JP3 Only.

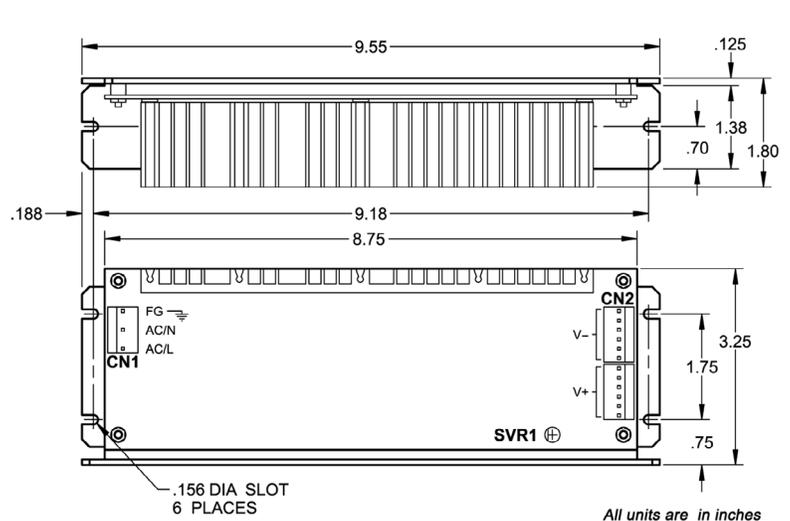

Figure 2: Dimensions for PSAM48V3.2A

Absolute Maximum Ratings

Input Voltage: 80VDC

Output Current: 10.0 Amps Peak

Max Plate Temperature: 70°C

Storage Temperature: 0° to +50°C

Electrical Specifications

Item	Min	Typ	Max	Units
Input Voltage	20		80	VDC
Phase Output Current	1.1		7.1	A (RMS)
Phase Output Current	1.5		10.0	A (PEAK)
Input Voltage (Inputs)	3.5		8.6	VDC
Clock Frequency	0		100	kHz
Chopping Frequency	27	30	33	kHz
Operation Temperature	0		70	C

Table 2: MBC12101 Electrical Specifications

Setting the Output Current

WARNING: Do not set the current setting above the step motors rated current. When using a higher current into a motor, the motor will overheat and burnup. Should this occur, the driver will also be damaged.

The output current on the MBC12101 is set by and onboard potentiometer. This potentiometer determines the per phase peak output current of the driver. The relationship between the output current and the potentiometer value is as follows:

Peak Current	Potentiometer Setting	Peak Current	Potentiometer Setting
1.5A	0%	7.0A	60%
2.3A	10%	7.9A	70%
3.1A	20%	8.7A	80%
4.0A	30%	9.6A	90%
5.0A	40%	10A	100%
6.0A	50%	--	--

Table 3: Potentiometer values with respect to the output current
Refer to Table 5 for specific motor current settings.

Reducing Output Current

Reducing the output current occurs approximately 1 second after the last positive going edge of the step clock input. The amount of current per phase in the reduction mode is approximately 50% of the set current. Reducing the output current is accomplished when no current flows through the opto-diode at the CLOCK (+) and CLOCK (-) pins after the last step has occurred. The clock LED should be off at this time.

Motor Selection

The MBC12101 is a Bipolar Microstep driver that is compatible with both Bipolar and Unipolar Stepper Motor Configurations, (i.e. 8 and 4 lead motors, and 6 lead center tapped motors).

Stepper Motors with low current ratings and high inductance will perform better at low speeds, providing higher low-end torque. Motors with high current ratings and low inductance will perform better at higher speeds, providing more high-end torque. Higher voltages will cause the current to flow faster through the motor coils. This in turn means higher step rates can be achieved. *Care should be taken not to exceed the maximum voltage of the driver.*

Since the MBC12101 is a constant current source, it is not necessary to use a stepper motor that is rated at the same voltage as the supply voltage. What is important is that the MBC12101 is set to the appropriate current level based on the motor being used. Refer to the following chart for setting the current potentiometer based on the current code in the part number of the motor. Examples of motor part numbers are shown below. Anaheim Automation offers a comprehensive line of step motors in 08, 11, 14, 15, 17, 23, 24, 34 and 42 frame sizes. Contact the factory to verify motor compatibility with the MBC12101.

Step Motor Current Setting Guide

Motor Example	Motor Current Number Code	Unipolar Rating	Series Peak Rating	Parallel Peak Rating	Series Current Setting	Parallel Current Setting
23D102S	02	1.0A	1.0A	2.0A	----	5%
23L303D-LW8	03	1.5A	1.5A	3.0A	0%	20%
34N104S-LW8	04	2.0A	2.0A	4.0A	5%	30%
23L4005D-LW8	05	2.5A	2.5A	5.0A	10%	40%

Setting the Output Current

The output current for the stepper motor being used when microstepping is determined differently from that of a full/half step unipolar driver. In the MBC12101, a sine/cosine output function is used in rotating the motor. The output current for a given motor is determined by the motors current rating and the wiring configuration of the motor. There is a current adjustment potentiometer used to set the output current of the MBC12101. This sets the peak output current of the sine/cosine waves. The specified motor current (which is the unipolar value) is multiplied by a factor of 1.0, 1.4, or 2.0 depending on the motor configuration (series, half-coil, or parallel).

WARNING: Do not set the current setting above the step motors rated current. When using a higher current into a motor, the motor will overheat and burnup. Should this occur, the driver will also be damaged.

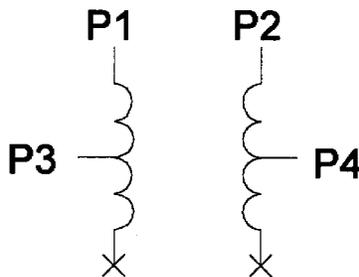

Stepper Motor Configurations

Stepper Motors can be wired with 4, 6, or 8 leads. Each configuration requires different currents. Refer to the lead configurations and the procedures to determine their output current.

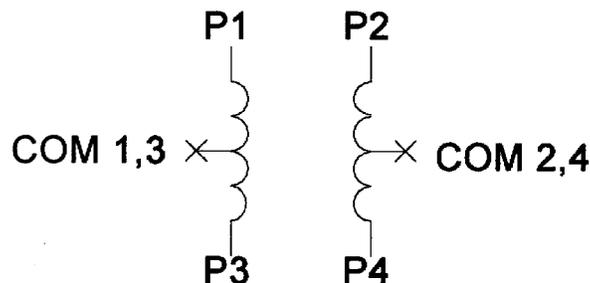

WARNING: Step motors will run hot even when configured correctly. Damage may occur to the motor if a higher than specified current is used. Most specified motor currents are maximum values. Care should be taken to not exceed these ratings.

6 Lead Motors

When configuring a 6 lead motor in a **half-coil configuration** (connected from one end of the coil to the center tap), multiply the specified per Phase (or unipolar) current rating by 1.4 to determine the current setting potentiometer value. This configuration will provide more torque at higher speeds when compared to the series configuration.

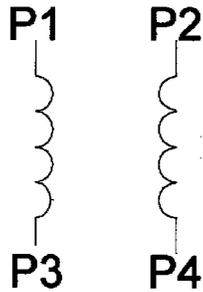

When configuration the motor in a **series configuration** (connected from end to end with the center tap floating) use the specified per Phase (or unipolar) current rating to determine the current setting potentiometer value.

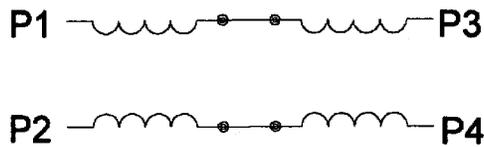

4 Lead Motors

Multiply the specified **series** motor current by 1.4 to determine the current adjustment potentiometer value. Four Lead Motors are usually rated with their appropriate series current, as opposed to the *Phase Current*, which is the rating for 6 and 8 lead motors.

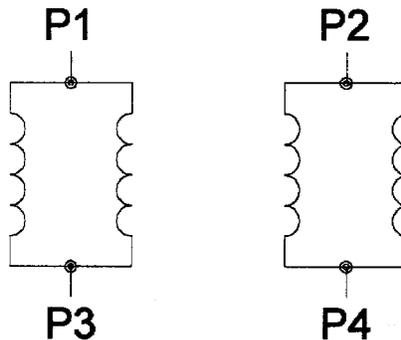

8 Lead Motors

Series Connection: When configuring the motor windings in series, use the per Phase (or unipolar) current rating to determine the current setting potentiometer value.

Parallel Connection: When configuring the motor windings in parallel, multiply the per Phase (or unipolar) current rating by 2.0 to determine the current setting potentiometer value.

Note: After the current has been determined, according to the motor connections above, use Table 3 to choose the proper setting for the current setting potentiometer.
